

# DO-332 OOP Verification Architecture

## Component Overview

## Package Descriptions

### oop\_types

Core type definitions for OOP constructs:

- Class\_Info, Method\_Info, Field\_Info
- Inheritance\_Link, Dependency
- VTable\_Entry
- DAL requirements

### oop\_analysis

Main analysis framework:

- Class hierarchy container
- Analysis configuration
- Result types
- Orchestration functions

## inheritance\_analyzer

DO-332 OO.1 implementation:

- Depth calculation
- Diamond detection
- Circular detection
- Override verification
- Ancestor tracking

## polymorphism\_verifier

DO-332 OO.2 implementation:

- Virtual method scanning
- Type counting
- LSP verification
- Covariance/contravariance

## dispatch\_analyzer

DO-332 OO.3 implementation:

- Target resolution
- Site analysis
- Devirtualization
- Bounded dispatch proof

## coupling\_analyzer

DO-332 OO.4 implementation:

- Dependency graph
- CBO, RFC, LCOM metrics
- Circular dependency detection
- Threshold checking

## test\_generator

Test case generation:

- Per-objective tests
- Coverage point tracking
- Template-based generation

## Data Flow

```

IR Input → Parse → Build Hierarchy → Analyze → Generate Reports
                                     |
                                     ├── Inheritance Analysis
                                     ├── Polymorphism Verification
                                     ├── Dispatch Analysis
                                     ├── Coupling Analysis
                                     └── Test Generation
  
```

## SPARK Contracts

All analysis functions include SPARK contracts:

- Preconditions validate inputs

- Postconditions guarantee properties
- Type invariants ensure consistency
